**Health price growth falls to 1.5%**

**HIGHLIGHTS**

▲ Health care prices in June 2017 rose 1.5% above June 2016, the lowest annual growth rate since May 2016.

▲ Year-over-year hospital price growth fell to 1.4%, from 1.5% in May. Physician and clinical services price growth rose by one-tenth to a still low 0.6% rate. Annual drug price growth also fell one-tenth to a 3.8% rate, well below its 20+ year high of 7.0% recorded in November 2016.

▲ Economy-wide price indices exhibited lower growth. The Consumer Price Index (CPI) fell to 1.6% growth in June from 1.9% in May, the final-demand Producer Price Index (PPI) fell to 2.0% from 2.4%, and the gross domestic product deflator (GDPD) fell from 1.3% to 1.2%.

▲ Combining price and health spending data shows implicit per capita health care utilization growth year over year at 2.4% in June, slightly above its 12-month average of 2.2%.

**HEALTH CARE AND ECONOMY-WIDE PRICES**

In June 2017, the Health Care Price Index (HCPI) rose 1.5% above June 2016. The 12-month moving average, at 1.9% growth, is unchanged for 4 months. The HCPI declined from 3.4% in October 2009, oscillated near 2% growth for 2 years, hit a historic low of 0.9% in December 2015, and increased sharply through 2016 but has now reversed that surge (Exhibit 1). We thought that the HCPI would stay above 2% and even trend higher. Instead, we now see five straight months below that rate. Economy-wide price inflation, as measured by the GDPD, trended upward beginning in September 2009, peaked at 2.4% in September 2011, and stands at 1.2% year-over-year growth as of June 2017. The HCPI growth rate is mostly tracking the GDPD rate. Exhibit 5 shows long-term comparisons.

**Exhibit 1. Year-over-Year Growth Rates in HCPI and GDPD**

![Year-over-Year Growth Rates in HCPI and GDPD](chart)

Note: This exhibit compares monthly prices with the same month from the previous year.

Since the start of the recession in December 2007, health care prices have increased only 19.1% (up one-tenth since May), while prices in the economy as a whole (using the GDPD) have increased 15.2% (Exhibit 2). Per last month, low economy-wide inflation and structural changes in the health sector are putting downward pressure on health care prices, and Affordable Care Act repeal and replace uncertainty appears to be having a meaningful effect. In June, the CPI rose 1.6% above the previous year (down from 1.9% in May), and the medical CPI, emphasizing out-of-pocket prices, stayed at 2.7% growth, its lowest rate since December 2015. The final-demand PPI growth rate for June fell to 2.0%, from 2.4% in May.

HEALTH CARE PRICES BY CATEGORY

In June 2017, the annual price growth for prescription drugs, at 3.8%, was easily the fastest growing category, higher than nursing home care at 3.0% growth (the 2nd highest), and well above durable medical equipment (DME) which actually saw an annual price decline (-0.6%). Hospital price growth fell to 1.4%, from 1.5% in May, and physician price growth increased to 0.6% from 0.5% in May. Those two categories’ growth play a large role in the HCPI due to their high spending weight. Combine the DME negative rate and it’s easy to see why the aggregate index fell to 1.5% growth in June. Annual inflation rate comparisons—June 2017 year over year versus June 2016 year over year—show 3 categories higher (hospitals, physician services, and nursing home care), and the other 3 lower (Exhibit 3, with additional detail in Exhibit 4).

Price “momentum,” which highlights the latest three months of data, is lower for the aggregate HCPI and for six of the ten price categories. These data argue for a stable or even lower HCPI print in the July data.

Medicare and Medicaid hospital prices typically grow less quickly than private-sector prices. Hospital price growth for Medicare patients was steady at 0.9% in June, and also steady at 1.5% for Medicaid patients, and fell for private pay patients, from 2.0% in May to 1.8% in June. For “other” patients (e.g., Veterans, TRICARE, self-pay), hospital price growth was steady at 4.1% (data not shown). While hospital prices for privately-insured patients are growing slowly (the June 2017 rate is the lowest since the creation of the private-only series in June 2014), there is a large cumulative gap compared to public payments. Specifically, since June 2014, cumulative hospital prices for Medicare, Medicaid, and private pay patients have grown by -0.7%, -0.9%, and 7.1%, respectively.

PRICES, SPENDING, AND UTILIZATION

Trends in health care utilization and intensity can be computed from the price data combined with Altarum’s monthly health spending estimates.1

▲ Exhibit 6 displays year-over-year growth rates in personal health care spending broken out by price and utilization. The historic, downward trend in health spending growth that began in 2002 was due to declining utilization growth, followed by very low price growth. Utilization surged in 2014 and 2015, but has now stabilized. The readings for June 2017 are 4.6% spending growth and 3.1% utilization growth.

▲ Exhibit 7 shows per capita (implicit) utilization growth and highlights the decline between 2002 and 2010, then sharp growth and a jagged 24-year moderation. Per capita utilization in May rose at an annual rate of 2.4%—above its 12-month average of 2.2%. On a 12-month average basis, utilization for hospitals rose 2.7%, home health care is up 2.2%, physician services rose 4.5%, the prescription drug rate is down 1.5%, nursing care rose 0.2%, and dental care utilization is up 1.8%.

DISCUSSION

In June 2017, the HCPI rose by 1.5% compared to a year earlier, down one-tenth from May, and the lowest annual growth rate since May 2016. The 12-month moving average of the HCPI stands at 1.9% for the fifth straight month. Where only a few months ago, we were expecting the index to stay above 2% growth and trend higher, it has now clearly reversed course. Per last month, in addition to the uncertainty surrounding continuing efforts to repeal, replace, or even repair(?) the Affordable Care Act, economy-wide prices are putting renewed downward pressure on the health sector. This is visible for the durable medical equipment price growth in June (-0.6%), though this represents a small share of personal health care spending.

We pay close attention to the hospital and physician components of the price index. The former fell from 1.5% growth in May to 1.4% in June; the latter increased to a still very low 0.6% growth rate. These categories helped to barely push the HCPI rate down, with a small assist from prescription drugs whose growth fell one-tenth to 3.8% in June.

As we note each month, health care inflation is quite low for this stage of the economic recovery. June 2017 was the 96th month of expansion following the Great Recession, yet we see declining HCPI growth! Hospital prices for privately-insured patients exhibited an annual growth rate of 1.8% in June, the lowest reading since this specific category was created in June 2014. Looking ahead, in early August, the Centers for Medicare & Medicaid Services finalized 2018 payment rates for skilled nursing, hospice, inpatient rehabilitation, and the inpatient prospective payment system.2 We will discuss this further in upcoming months, but the takeaway for now is that the government, via statute and regulatory activity, does not appear eager to take the pressure off of payments.
